DATE MAILED: 11/14/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

Application No.

10/663,691

Applicant(s)

INAO ET AL.

Examiner

John Ruggles

Art Unit

1756

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 30 August 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1,4-14 and 16-18 is/are pending in the application.
- 4a) Of the above claim(s) 5-14 and 16 is/are withdrawn from consideration.
- 5) ☐ Claim(s) none is/are allowed.
- 6) ☒ Claim(s) 1,4,17 and 18 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 03 March 2006 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination (RCE) under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application on 8/30/06 after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous 5/8/06 Office action has been withdrawn pursuant to 37 CFR 1.114. Applicants' submission filed on 8/4/06 has now been entered with the 8/30/06 RCE.

### ***Response to Amendment***

In the currently entered 8/4/06 submission, claim 1 is currently amended, claims 2-3 and 15 remain as previously cancelled, claims 4 and 17-18 remain as previously presented, and claims 5-14 and 16 remain withdrawn as previously non-elected. Therefore, only claims 1, 4, and 17-18 remain under consideration.

The previous drawings objection numbered (v) is withdrawn in view of Applicants' current amendments, but other drawings objections still remain as indicated below.

While the previous specifically exemplified objections to the specification numbered (8)-(12) are withdrawn in view of Applicants' current amendments, examples of further specification objections still remaining are given below. Also stated below are a suggested new title and objections of the abstract, because both the title and abstract should incorporate additional language to be more descriptive of the elected claims (particularly claim 1 as currently amended).

Art Unit: 1756

The current amendment of claim 1 has necessitated a new rejection under the second paragraph of 35 U.S.C. 112, as well as requiring revision of the previous prior art rejections of the elected claims under 35 U.S.C. 103(a), both of which are set forth below.

### ***Drawings***

The previous drawings objection numbered (v) is withdrawn in view of Applicants' current amendments, but other drawings objections still remain as indicated below.

The drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they do not include the following reference sign(s) mentioned in the description: (vi) at least at page 54 lines 17 and 22, reference sign "440A" is not labeled in either of Figures 6 or 9 to which this passage may refer (even though "Figure 8" is referenced at page 54 line 19, this is **not** believed to be the best drawing to illustrate exposure light passing through the transmitting window 620, the vessel 610, and the mask 400A for producing near-field patterned light on the underlying resist 720); (vii) at page 56 line 12, "Figure 7" was not found among the drawings and should be corrected to the most appropriate representative drawings (e.g., --Figure 7A--, etc.); (viii) at page 56 line 25, "mask 400" was not so labeled in Figure 7A (to which this passage is thought to refer) and should be corrected to a more appropriate label that is found in the drawing (e.g., --mask 400A--, etc.); and (ix) at page 58 line 15, the small openings "432" of the mask were not so labeled in the drawings (e.g., Figure 9, etc.) and should therefore be corrected to --432A--.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. Each drawing sheet submitted after the filing date of

Art Unit: 1756

an application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

### *Specification*

The title of the invention is not fully descriptive of the elected claims currently under consideration. A new title is required that is clearly indicative of the invention to which the elected claims are directed.

The following title is suggested: ~~--MASK, EXPOSURE APPARATUS, AND NEAR-~~  
FIELD EXPOSURE METHOD THROUGH A MASK HAVING AN OPENING WITH  
ORTHOGONAL LENGTHWISE DIRECTIONS BY USING INCIDENT LIGHT POLARIZED  
AT ABOUT 45° FROM THE ORTHOGONAL LENGTHWISE DIRECTIONS--.

The abstract of the disclosure is objected to because it does not correspond with the elected claims. In particular, the abstract should be amended to also incorporate: (A) the use of near-field exposure light produced through the mask from (B) incident light polarized at an angle of approximately 45° from the orthogonal lengthwise directions of the mask opening; and (C) that the lengthwise portions of the mask opening each have a width that is smaller than the wavelength of the exposure light (as currently added to claim 1). Correction is required. See MPEP § 608.01(b).

35 U.S.C. 112, first paragraph, requires the specification to be written in "full, clear, concise, and exact terms." The specification is still replete with terms, which are not clear, concise and exact. The specification should again be revised carefully in order to comply with

Art Unit: 1756

35 U.S.C. 112, first paragraph. Examples of some remaining unclear, inexact or verbose terms used in the specification are: (13) Applicants should correct all errors throughout the specification of which they become aware, especially when such errors are similar to those previously listed and further exemplified below; (14) at page 17 line 2, "th " is clearly misspelled; and (15) at page 37 line 27, "larg " is also clearly misspelled, but neither has been corrected by Applicants even though such corrections were requested under the previous specification objection numbered (13). (16) Furthermore, Applicants' current amendment at page 8 line 19 has introduced a new misspelling "*incidnet* light" (emphasis added), which must be corrected to --~~incidnet~~ incident light--, as was previously requested under objection (10). Note that due to the number of errors, those listed here are merely examples of the corrections needed and do not represent an exhaustive list thereof.

Appropriate correction is required. An amendment filed making all appropriate corrections must be accompanied by a statement that the amendment contains no new matter and also by a brief description specifically pointing out which portion of the original specification provides support for each of these corrections.

### ***Claim Rejections - 35 USC § 112***

The current amendment of claim 1 has necessitated a new rejection under the second paragraph of 35 U.S.C. 112, as set forth below.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Art Unit: 1756

Claims 1, 4, and 17-18 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 1 lines 10-11, "the opening has a width that is smaller than a wavelength of the exposure light" is unclear about how the width of the mask opening is to be measured for comparison to the exposure wavelength. For an "L"-shaped opening having two perpendicular legs or portions on the mask (as shown in Figure 5), the width of the opening could be measured (1) diagonally across the distal ends of the leg portions [resulting in the greatest width across the entire opening], (2) along the lengthwise direction of each leg portion [resulting in an intermediate, but still relatively large width across the entire opening], or (3) across the width of each separate leg portion of the opening [perpendicular to the lengthwise direction of that leg portion, resulting in the smallest width measurement]. However, since the width of each leg portion is shown to be much narrower than the length of that leg portion in Figure 5, claim 1 lines 10-11 is interpreted in accordance with (3) above for the purpose of this Office action. Claims 4 and 17-18 depend from claim 1.

***Claim Rejections - 35 USC § 103***

The current amendment of claim 1 has necessitated revision of the previous prior art rejections under 35 U.S.C. 103(a), as set forth below.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 4, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over either Kuroda et al. (US 6,171,730) or Kuroda et al. (US 6,187,482) in view of Alkaisi, M. M. et al. ("Sub-diffraction-limited patterning using evanescent near-field optical lithography", (1999) Applied Physics Letters), and especially further in view of Schrieber (US 4,623,977), Chung et al. (US 2001/0052981), and/or Bentz (US 2002/0152248).

Kuroda et al. '730 teach a near field evanescent light exposure process and a near field exposure apparatus that includes a near field mask having an opaque shading layer with aperture widths of about 100 nm or less (title, abstract), but preferably in the range of 1-100 nm, as shown by Figures 2A and 2B (col. 5 line 41 to col. 6 line 40). Col. 1 lines 13-25 suggest that the presently used near field ultraviolet (UV) laser light source (*instant claim 18*) has a wavelength at about 0.1  $\mu\text{m}$  (100 nm) or larger, which is understood to mean that the opaque shading layer aperture width is less than the wavelength of exposure light so that the ratio of the aperture width to the wavelength of exposure light must be between 1 and 1/100, or even smaller. Figures 1A and 1B show close contact between the mask 106 and the resist 107 during exposure (col. 3 lines 58-67 and col. 5 lines 9-24). Figure 2A shows rectangular block form L-shaped slit openings in the opaque shading layer on the near field mask (col. 6 lines 40-42, which reads on the instant claims for resist exposure through a mask opening formed with lengthwise directions extending only in different and mutually orthogonal directions).

Kuroda et al. '482 teach a near field mask for evanescent light exposure and an apparatus for making a pattern using the near field mask (title, abstract). The mask includes a transparent base or substrate 201 and a metallic thin film shading member 203 having minute apertures 204,

Art Unit: 1756

each having a width  $< 100$  nm, which is small in comparison with the wavelength of exposure light (abstract, Figure 2, col. 4 lines 49-54). Figure 1 shows a laser 101 for projecting laser light 102 for exposure (*instant claim 18*) towards a mask 106, which is in close contact with a resist 107 during the exposure (col. 4 lines 1-2, 30-32, and 35-36). Figure 3A shows hook-shaped (rectangular block form L-shaped) slit openings 303 having two perpendicular lengthwise directions in the opaque shading layer on the near field mask (col. 8 lines 10-14, which reads on the instant claims for resist exposure through a mask having an opening formed with lengthwise directions extending only in different and mutually orthogonal directions).

Neither Kuroda et al. '730 nor Kuroda et al. '482 specifically teach *[1]* detecting one of the lengthwise directions of the opening and projecting light for exposure of the resist that is polarized in a direction of an angle of approximately  $45^\circ$  with respect to lengthwise mutual orthogonal directions of the mask opening (*instant claims 1 and 4*).

Alkaisi et al. teach clear and faithful reproduction through a near-field mask having rectangular apertures or openings that are 70 nm wide (which is  $< 1/5$  times the wavelength of incident light). High transmission (intensity of transmitted light) through the mask openings is always achieved for at least one polarization of incident light through the near-field mask as shown by Figure 2(b) (page 3561, left col., fourth full paragraph). Polarization of incident light in the direction perpendicular to the length (in the same direction as the width) of mask apertures (for transverse magnetic (TM) polarization) results in high light transmission through the mask openings to expose a resolved pattern in the top 40 nm of the resist layer (as shown in Figure 3(a) on page 3562, left col., last paragraph), whereas polarization of incident light in the direction parallel to the length of mask openings (for transverse electric (TE) polarization) does

Art Unit: 1756

not result in a clearly resolved pattern to any depth at all in the resist layer (as shown in Figure 3(b) on page 3562, right col., lines 1-4). Thus, exposure of the resist will be dominated by the well-resolved, high-intensity TM polarization profile (page 3562, right col., lines 4-7).

It would have been obvious to one of ordinary skill in the art at the time of the invention that a process of exposing a resist through a near field mask having an opening formed with lengthwise directions extending in only first and second mutually orthogonal directions (as taught by either Kuroda et al. '730 or Kuroda et al. '482) by linear polarized exposure light aligned in the same direction as the width of the first lengthwise opening direction (such that the exposure light is polarized at an angle of  $90^\circ$  from the first lengthwise opening direction) on the mask would be expected to cause exposure of the resist that is dominated by a well-resolved, high-intensity polarized profile only under the first lengthwise opening direction on the near field mask (full intensity exposure, as taught by Alkaisi et al.). However, no significant exposure at all would be obtained in the resist under the second lengthwise mutually orthogonal opening direction on the mask (which runs in a direction at an angle of  $0^\circ$  from the direction in which the exposure light is polarized, no intensity exposure, as taught by Alkaisi et al.). In order to achieve a uniform exposure through both of the first and second mutually orthogonal directions of the mask opening, it would have been obvious to one of ordinary skill in the art that the linear polarization of the exposure light should not be aligned with either the first or the second mutually orthogonal directions of the mask opening [1]. In fact, it would logically be expected from the teachings of either Kuroda et al. '730 or Kuroda et al. '482 in view of Alkaisi et al. that the intensity of exposure light on the resist under both the first and second mutually orthogonal directions of the mask opening can be at least nearly equalized when the exposure light is

Art Unit: 1756

linearly polarized in a direction at an angle of about half-way between  $0^\circ$  and  $90^\circ$  (or approximately  $45^\circ$ ) with respect to the first and second lengthwise mutually orthogonal directions of the mask opening [1]. The nearly equalized exposure intensity from the first and second lengthwise mutually orthogonal directions of the mask opening achieved from this exposure light linearly polarized at approximately  $45^\circ$  would be about half-way between the former full intensity under the first lengthwise opening direction for exposure light linearly polarized at an angle of  $90^\circ$  thereto and the former zero intensity under the second lengthwise opening direction for exposure light linearly polarized at an angle of  $0^\circ$  thereto. In practice, it is well known in the art of resist exposure that the characteristics of the mask must necessarily be determined and utilized to set optical exposure conditions (e.g., for at least the reasons taught by Alkansi et al., etc. ). Therefore, it would also have been obvious to detect the lengthwise mutually orthogonal directions of the mask opening before determining or controlling the exposure light linear polarization (e.g., at an angle of approximately  $45^\circ$  from the lengthwise mutually orthogonal directions of the mask opening, etc.) and intensity on the basis of the detected lengthwise mutually orthogonal directions of the mask opening, because this would reasonably be expected by one of ordinary skill in the art to succeed in ensuring the desired degree of uniform exposure in the underlying resist [1].

The logical reason for the above expectation of success is a matter of simple linear interpolation between known data points. Linear interpolation has been a long-standing and notoriously well-known technique, as taught by Schrieber (col. 35 lines 3 and 12-14). Interpolation is also considered to be correct for linear phenomena, according to Chung et al. (paragraph [0060]). Bentz states that linear interpolation may be the simplest, fastest, and most

Art Unit: 1756

commonly implemented form of interpolation, which is based on a straight line relationship between two values, points, etc. Linear interpolation is a well-known mathematical operation that computes a value between two known values given the ratios of a distance from each known value to an intermediate value divided by the distance between the two known values [0002].

Application of linear interpolation to the instant claims can be illustrated as follows. For a mask having an opening with mutually orthogonal or perpendicular first and second lengthwise directions so that the first lengthwise direction is at  $0^\circ$  and the second lengthwise direction is at  $90^\circ$ , it is known from Alkaisi et al. that (A) polarization of the incident exposure light at  $0^\circ$  would yield no exposure (0%) intensity under the first lengthwise direction and full exposure (100%) intensity under the second lengthwise direction of the mask opening, but that (B) polarization of the incident exposure light at  $90^\circ$  would yield full exposure (100%) intensity under the first lengthwise direction and no exposure (0%) intensity under the second lengthwise direction of the mask opening. Since both the  $0^\circ$  polarization and the  $90^\circ$  polarization yield undesirably non-uniform and opposite resist exposures under the first and second lengthwise directions of the mask opening, linear interpolation clearly and logically suggests to one of ordinary skill in the art that polarization at an angle half-way between  $0^\circ$  and  $90^\circ$  (or  $45^\circ$ ) would be expected to provide equalized half exposure (50%) intensity under each of the first and second lengthwise directions of the mask opening, in order to form a uniformly exposed pattern in the underlying resist.

Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over either Kuroda et al. (US 6,171,730) or Kuroda et al. (US 6,187,482) in view of Alkaisi, M. M. et al. ("Sub-diffraction-limited patterning using evanescent near-field optical lithography", (1999) Applied

Art Unit: 1756

Physics Letters), especially in view of Schrieber (US 4,623,977), Chung et al. (US 2001/0052981), and/or Bentz (US 2002/0152248), further in view of Naya (US 2002/0196420), and further in view of either Matsuura et al. (US 4,566,795), Kato et al. (US 5,726,757), Fujimoto et al. (US 2003/0044730), or Nishikata (US 6,523,748).

Neither Kuroda et al. '730, Kuroda et al. '482, Alkaisi et al., Schrieber, Chung et al., nor Bentz specifically teach [2] detecting one of the lengthwise directions of the mask opening on the basis of an index mark on the mask that bears information for detecting one of the lengthwise directions of the opening (*instant claim 17*).

Naya teaches a near-field exposure system or apparatus and a method for imaging a photosensitive material or resist (title, abstract). In order to ensure sufficient near-field light exposure, the resist 11 is closely contacted to a near-field mask 14 during exposure (as shown in Figure 2, paragraphs [0052, 0057]). When the mask has pattern openings constituted by lines extending in more than one direction (which encompasses a mask having an opening formed with lengthwise directions extending in plural directions that include first and second mutually orthogonal directions), circularly polarized exposure light (that is polarized in a direction other than those of the opening lengthwise directions on the mask) should be used to prevent uneven exposure or thickening of imaged lines from the mask opening having different lengthwise directions so that a fine pattern in the resist can be formed during exposure [0070]-[0071]. The direction of a linear polarization is optionally adjusted or controlled by a polarizer plate that is rotated to a desired position based on the (detected) direction(s) of lines in the mask opening pattern ([0024], which enables the polarization to be selected in any desired direction with

Art Unit: 1756

respect to plural lengthwise directions of lines in the mask opening, including first and second mutually orthogonal directions of lines in the mask opening).

Alignment or index marks on a mask to detect the position of the mask (e.g., having openings in predetermined directions, etc.) are very well known. For example, Matsuura et al. teach diagonal index marks oriented at an angle of  $45^\circ$  on a mask, as shown in Figures 17B and 18 (col. 15 lines 35-45). Kato et al. also teach index marks oriented at an angle of  $45^\circ$  on a mask, as shown in Figures 25A-25E (col. 5 lines 5-7 and col. 18 lines 6-12). These index marks are very similar to Applicants' index marks 434, as shown in instant Figure 2A. More specific information can also be recorded in index marks on a mask by the use of characters or symbols of any kind, including a bar code, which is detected by reading the information for identifying details about the mask or the pattern thereon (Fujimoto et al., [0020], [0035]-[0036], [0040]). Nishikata (Figures 2-3, col. 5 line 57 to col. 6 line 7, col. 7 lines 21-47, and col. 9 lines 27-34) teaches another example of index codes or bar codes on a mask for specific information used to determine or detect details about the mask or the pattern thereon.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention in the method that includes detecting one or more of the lengthwise directions of a mask opening on the mask before determining or controlling the exposure light linear polarization (e.g., at an angle of approximately  $45^\circ$  from the lengthwise mutually orthogonal directions of the mask opening, etc.) and intensity on the basis of the detected lengthwise mutually orthogonal directions of the mask opening (that would have been obvious over Kuroda et al. '730 or Kuroda et al. '482, Alkaisi et al., and especially Schrieber, Chung et al., and/or Bentz for at least the reasons discussed above) to include an index mark on the mask that bears

Art Unit: 1756

information for detecting one or more of the lengthwise directions of the mask opening (as taught by Matsuura et al., Kato et al., Fujimoto et al., or Nishikata, *instant claim 17, [2]*), because this would reasonably be expected to prevent uneven exposure or thickening of imaged lines from the mask opening having different lengthwise directions so that a fine uniformly exposed pattern can be formed in the underlying resist (as taught by Naya).

### ***Response to Arguments***

Applicants' arguments on pages 11-13 of the currently entered 8/4/06 amendment with respect to claims 1, 4, and 17-18 have been considered, but they are moot in view of the new ground(s) of rejection presented above.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John Ruggles whose telephone number is 571-272-1390. The examiner can normally be reached on Monday-Thursday and alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Huff can be reached on 571-272-1385. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
